# Java Graphics & GUIs (and Swing/AWT libraries)

CSE 331  
Software Design & Implementation

Slides contain contributions from: M. Ernst, M. Hotan, R. Mercer, D. Notkin, H. Perkins, S. Regis, M. Stepp;  
Oracle docs & tutorial, Horstmann, Wikipedia, ...

---

# Why study GUIs?

---

- Learn about *event-driven programming* techniques
- Practice learning and using a large, complex API
- A chance to see how it is designed and learn from it:

- design patterns: model-view separation, callbacks, listeners, inheritance vs. delegation
- refactoring vs. reimplementing an ailing API

- Because GUIs are neat!

- *Caution:* There is way more here than you can memorize.
  - Part of learning a large API is "letting go."
  - First, learn the fundamental concepts and general ideas.
  - Then, look things up as you need them
  - Don't get bogged down implementing eye candy

# References

---

Today: Java graphics and Swing/AWT class libraries

Only an introduction! Also see

- *Core Java* vol. I by Horstmann & Cornell
- If you have another favorite, use it

Next lecture:

Event-driven programming and user interaction

# Outline

---

Organization of the Swing/AWT library

Graphics and drawing

Repaint callbacks, layout managers, etc.

Handling user events

Building GUI applications

MVC, user events, updates, &c

# Java GUI libraries

---

- **Swing:** the main Java GUI library
  - *Benefits:* Features; cross-platform compatibility; OO design
  - Paints GUI controls itself pixel-by-pixel
    - Does not delegate to OS's window system
- **Abstract Windowing Toolkit (AWT):** Sun's initial GUI library
  - Maps Java code to each operating system's real GUI system
  - *Problems:* Limited to lowest common denominator (limited set of UI widgets); clunky to use.
- Advice: Use Swing. You occasionally have to use AWT (Swing is built on top of AWT). Beware: it's easy to get them mixed up.

# GUI terminology

---

**window**: A first-class citizen of the graphical desktop

Also called a *top-level container*

Examples: frame, dialog box, applet

**component**: A GUI widget that resides in a window

Also called *controls* in many other languages

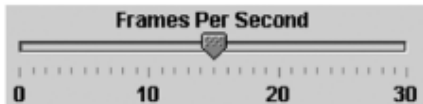

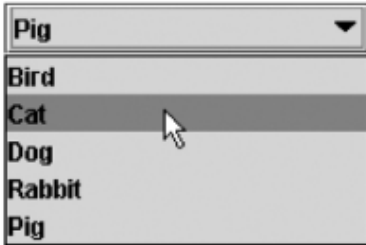

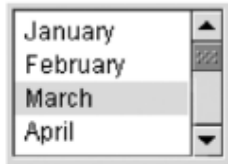

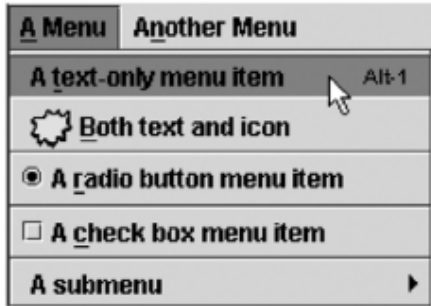

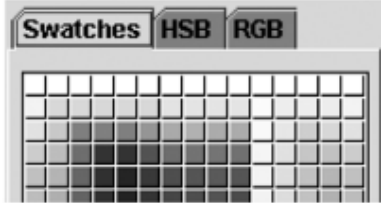

Examples: button, text box, label

**container**: A component that hosts (holds) components

Examples: panel, box

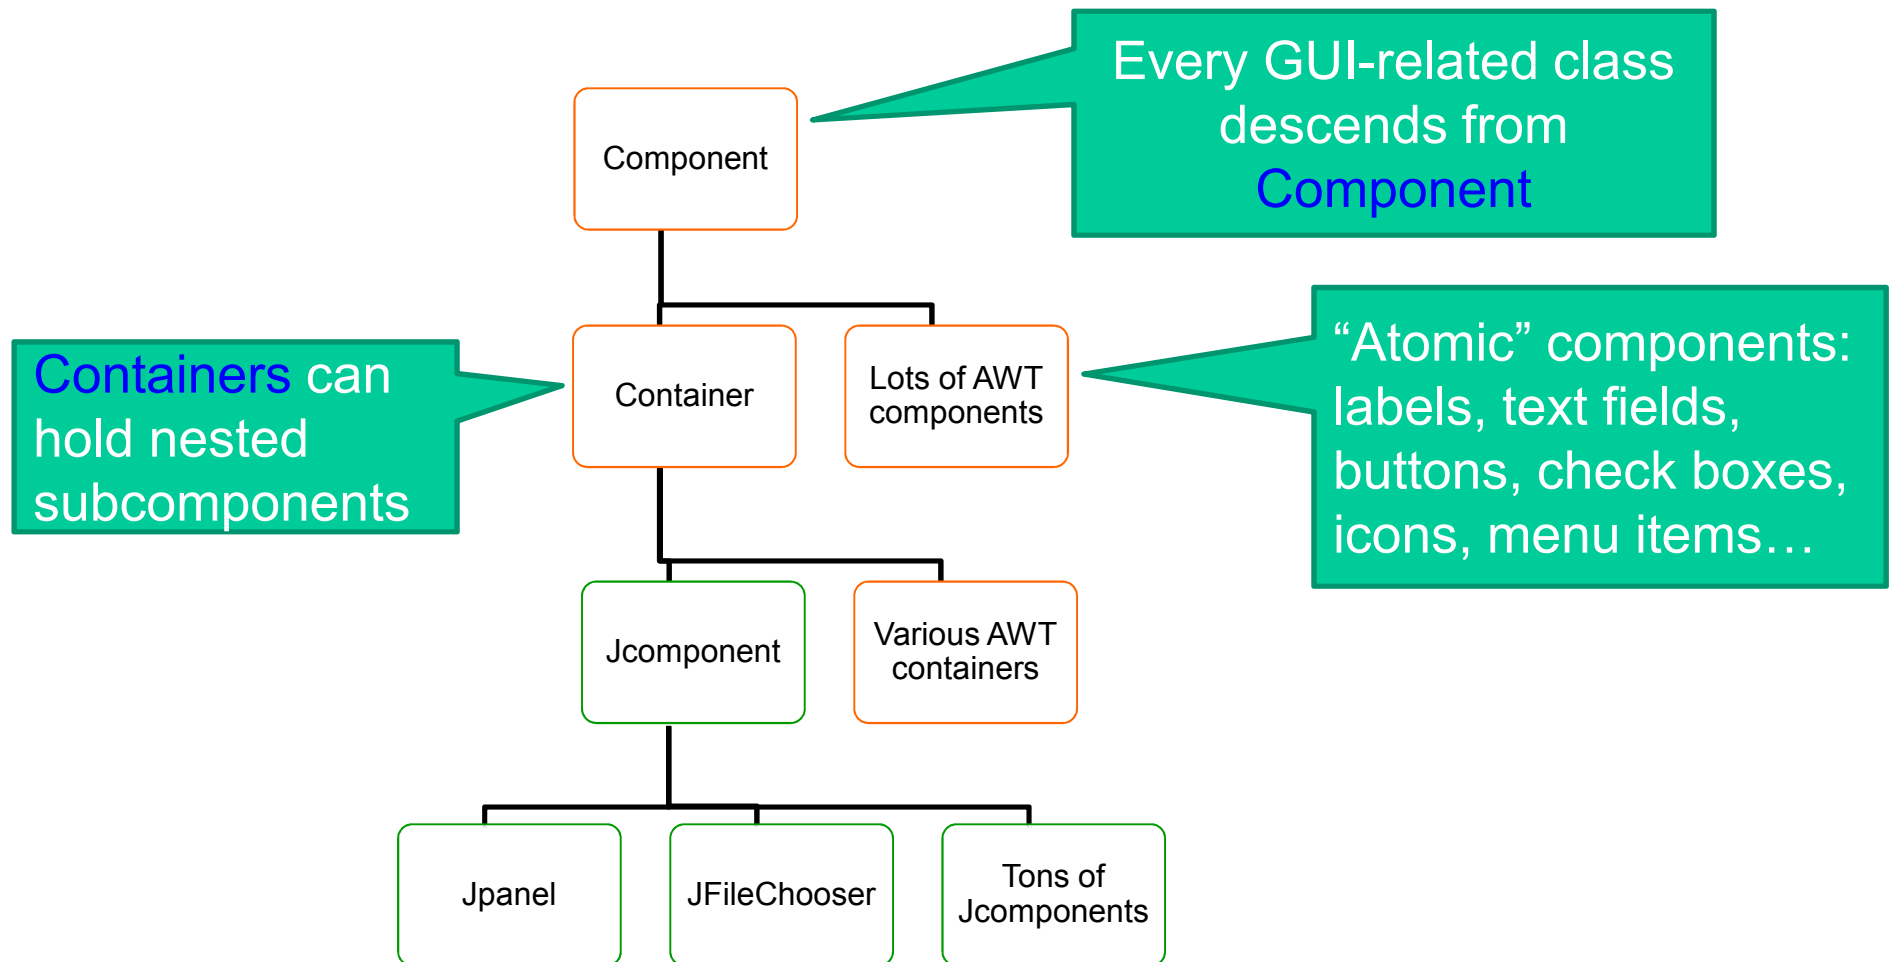

# Components

JButton 	JCheckBox 	JRadioButton 	 Image and Text Text-Only Label
JTextField 	JSlider 	JToolBar 	
JComboBox 	JList 	JMenuBar, JMenu, JMenuItem 	
JColorChooser 	JFileChooser 	JTable 	JTree 

# Component & container classes

---

# Swing/AWT inheritance hierarchy

---

**Component** (AWT)

**Window**

**Frame**

**JFrame** (Swing)

**JDialog**

**Container**

**JComponent** (Swing)

**JButton**

**JComboBox**

**JMenuBar**

**JPopupMenu**

**JScrollPane**

**JSplitPane**

**JToolBar**

**TextField**

**JColorChooser**

**JLabel**

**JOptionPane**

**JProgressBar**

**JSlider**

**JTabbedPane**

**JTree**

...

**JFileChooser**

**JList**

**JPanel**

**JScrollbar**

**JSpinner**

**JTable**

**JTextArea**

# Component fields (actually properties)

---

Each has a **get** (or **is**) accessor and a **set** modifier.  
Examples: **getColor**, **setFont**, **isVisible**, ...

name	description
background	background color behind component
border	border line around component
enabled	whether it can be interacted with
focusable	whether key text can be typed on it
font	font used for text in component
foreground	foreground color of component
height, width	component's current size in pixels
visible	whether component can be seen
tooltip text	text shown when hovering mouse
size, minimum / maximum / preferred size	various sizes, size limits, or desired sizes that the component may take

# Types of containers

---

- Top-level containers: JFrame, JDialog, ...
  - Often correspond to OS windows
  - Can be used by themselves, but usually as a host for other components
  - Live at top of UI hierarchy, not nested in anything else
- Mid-level containers: panels, scroll panes, tool bars
  - Sometimes contain other containers, sometimes not
  - JPanel is a general-purpose component for drawing or hosting other UI elements (buttons, etc.)
- Specialized containers: menus, list boxes, ...
- Technically, all J-components are containers

# JFrame – top-level window

---

Graphical window on the screen

Typically holds (hosts) other components

Common methods:

**JFrame** (**String** *title*) – constructor, title optional

**setSize** (**int** *width*, **int** *height*) – set size

**add** (**Component** *c*) – add component to window

**setVisible** (**boolean** *v*) – make window visible or not. Don't forget this!

# Example

---

SimpleFrameMain.java

# More JFrame

---

- `public void setDefaultCloseOperation(int op)`  
Makes the frame perform the given action when it closes.
  - Common value passed: `JFrame.EXIT_ON_CLOSE`
  - If not set, the program will never exit even if the frame is closed.
- `public void setSize(int width, int height)`  
Gives the frame a fixed size in pixels.
- `public void pack()`  
Resizes the frame to fit the components inside it snugly.

# JPanel – a general-purpose container

---

Commonly used as a place for graphics, or to hold a collection of button, labels, etc.

Needs to be added to a window or other container

```
frame.add(new JPanel (...))
```

**JPanels** can be nested to any depth

Many methods/fields in common with **JFrame** (since both inherit from **Component**)

Advice: can't find a method/field? Check the superclass(es)

Some new methods. Particularly useful:

```
setPreferredSize (Dimension d)
```

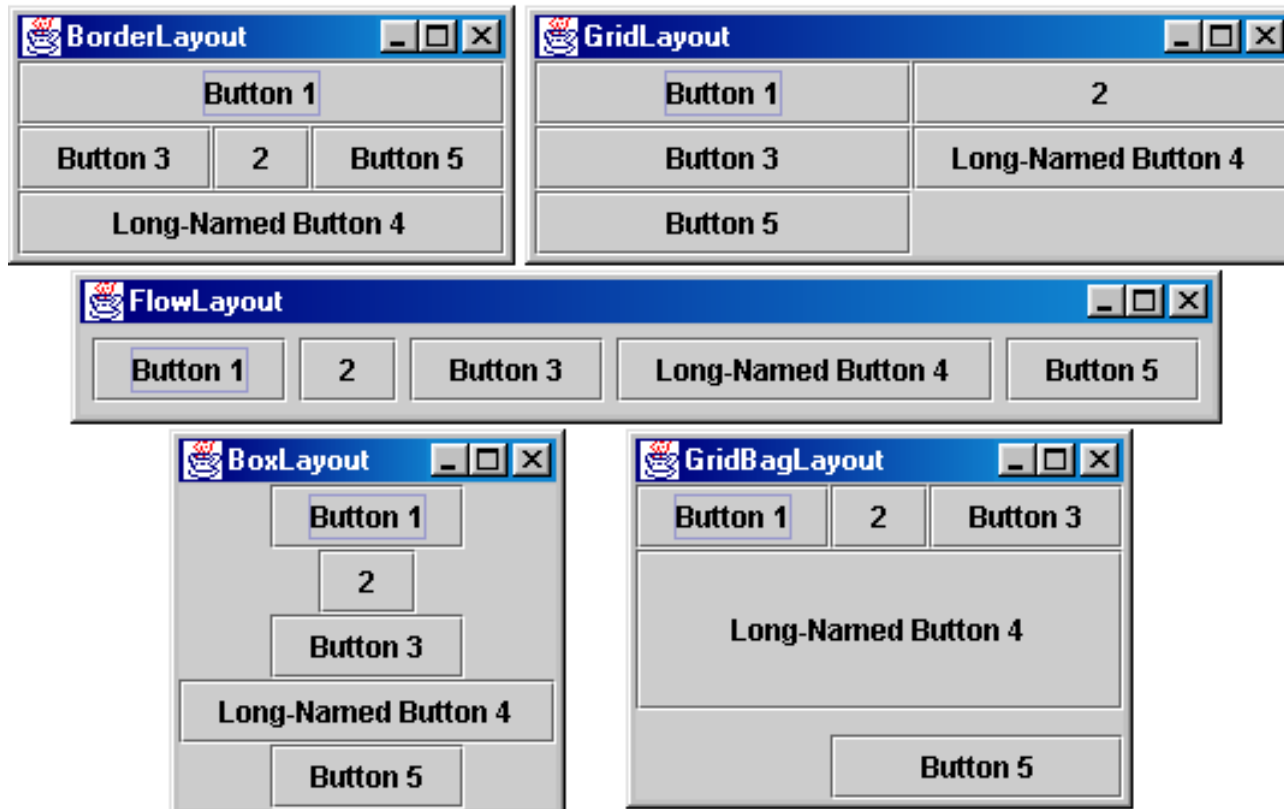

# Containers and layout

---

What if we add several components to a container?

How are they positioned relative to each other?

Answer: each container has a **layout manger**.

# Layout managers

---

Kinds:

- **FlowLayout** (left to right, top to bottom) – default for **JPanel**
- **BorderLayout** (“center”, “north”, “south”, “east”, “west”) – default for **JFrame**
- **GridLayout** (regular 2-D grid)
- others... (some are incredibly complex)

The first two should be good enough for now....

---

Place components in a *container*; add the container to a frame.

- **container**: An object that stores components and governs their positions, sizes, and resizing behavior.

# pack()

---

Once all the components are added to their containers, do this to make the window visible

```
pack ( ) ;  
setVisible (true) ;
```

**pack ( )** figures out the sizes of all components and calls the layout manager to set locations in the container (recursively as needed)

If your window doesn't look right, you may have forgotten **pack ( )**

# Example

---

SimpleLayoutMain.java

# FlowLayout

---

```
public FlowLayout()
```

- treats container as a left-to-right, top-to-bottom "paragraph".
  - Components are given preferred size, horizontally and vertically.
  - Components are positioned in the order added.
  - If too long, components wrap around to the next line.

```
myFrame.setLayout(new FlowLayout());  
myFrame.add(new JButton("Button 1"));
```

- The default layout for containers other than `JFrame` (seen later).

# BorderLayout

```
public BorderLayout ()
```

- Divides container into five regions:
  - NORTH and SOUTH regions expand to fill region horizontally, and use the component's preferred size vertically.
  - WEST and EAST regions expand to fill region vertically, and use the component's preferred size horizontally.
  - CENTER uses all space not occupied by others.

```
myFrame.setLayout (new BorderLayout ()) ;
```

```
myFrame.add(new JButton("Button 1"), BorderLayout.NORTH) ;
```

- This is the default layout for a JFrame.

# GridLayout

---

```
public GridLayout(int rows, int columns)
```

- Treats container as a grid of equally-sized rows and columns.
- Components are given equal horizontal / vertical size, disregarding preferred size.
- Can specify 0 rows or columns to indicate expansion in that direction as needed.

# Graphics and drawing

---

So far so good – and very boring...

What if we want to actually draw something? A map, an image, a path, ...?

Answer: Override method **paintComponent**

Method in **JComponent** that draws the component

In **JLabel**'s case, it draws the label text

# Example

---

SimplePaintMain.java

# Graphics methods

---

Many methods to draw various lines, shapes, etc., ...

Can also draw images (pictures, etc.). Load the image file into an **Image** object and use **g.drawImage(...)**:

- In the program (***not*** in **paintComponent**):

```
Image pic =  
    Toolkit.getDefaultToolkit()  
        .getImage(image path) ;
```

- Then in **paintComponent**:

```
g.drawImage(pic, ...);
```

# Graphics vs Graphics2D

---

Class **Graphics** was part of the original Java AWT

Has a procedural interface: `g.drawRect(...)` ,  
`g.fillOval(...)`

Swing introduced **Graphics2D**

Added a object interface – create instances of  
**Shape** like **Line2D**, **Rectangle2D**, etc., and add  
these to the **Graphics2D** object

Parameter to `paintComponent` is always **Graphics2D**.  
Can always cast it to that class. **Graphics2D** supports  
both sets of graphics methods.

Use whichever you like for CSE 331

# So who calls `paintComponent`?

## And when??

---

- Answer: the window manager calls `paintComponent` *whenever it wants!!!*
  - When the window is first made visible, and whenever after that it is needed
- Corollary: `paintComponent` must **always** be ready to repaint – regardless of what else is going on
  - You have no control over when or how often – must store enough information to repaint on demand
- If you want to redraw a window, call `repaint()` from the program (*not* from `paintComponent`)
  - Tells the window manager to schedule repainting
  - Window manager will call `paintComponent` when it decides to redraw (soon, but maybe not right away)

# Example

---

FaceMain.java

# How repainting happens

---

It's worse than it looks!

Your program and the window manager are running concurrently:

- Program thread
- User Interface thread

Do not attempt to mess around – follow the rules and nobody gets hurt!

# Rules for painting – Obey!

---

- Always override `paintComponent(g)` if you want to draw on a component
- Always call `super.paintComponent(g)` first
- **NEVER** call `paintComponent` yourself. That means **ABSOLUTELY POSITIVELY NEVER!!!**
- Always paint the entire picture, from scratch
- Use `paintComponent`'s `Graphics` parameter to do all the drawing. **ONLY** use it for that. Don't copy it, try to replace it, permanently side-effect it, etc. It is quick to anger.
- **DON'T** create new `Graphics` or `Graphics2D` objects
- Fine print: Once you are a certified™ wizard, you may find reasons to do things differently, but you aren't there yet.

# What's next – and not

---

Major topic next time is how to handle user interactions

Key idea: the observer pattern

Beyond that you're on your own to explore all the wonderful widgets in Swing/AWT. Have fun!!!

(But don't sink huge amounts of time into eye candy)
