User Interface Hall of Shame

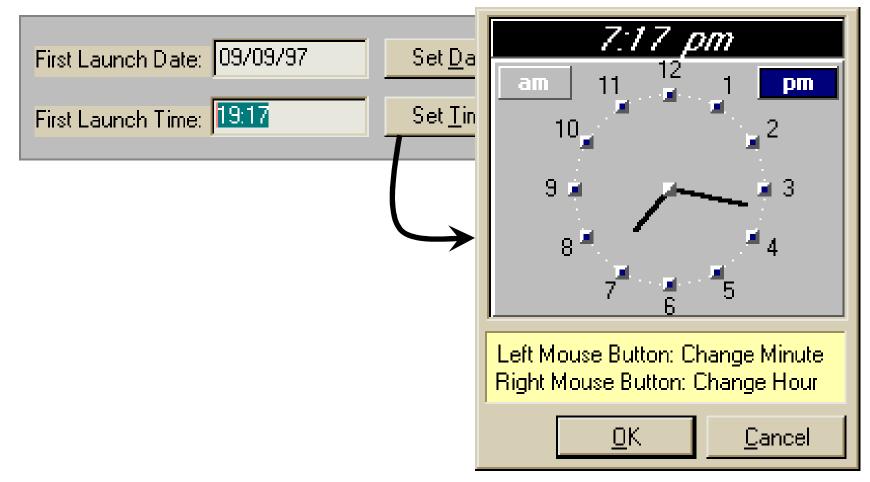

User Interface Hall of Shame

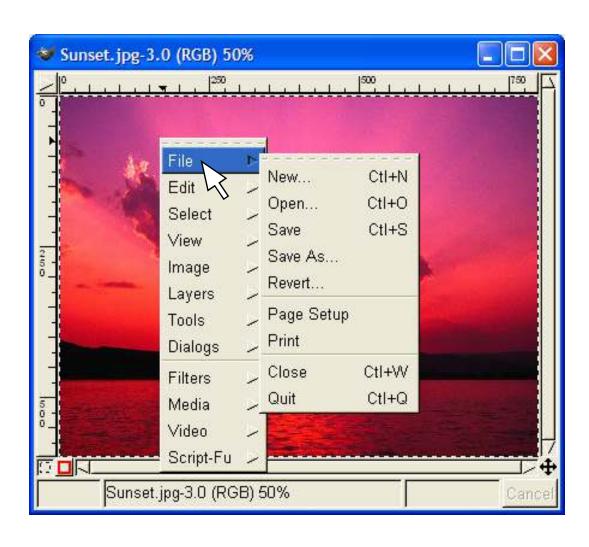

Redesigning the Interface

Another for the Hall of Shame

Hall of Fame or Hall of Shame?

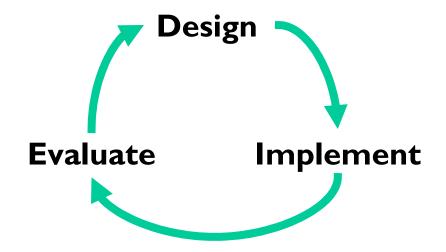

User Interfaces Are Hard to Design

- You are not the user
 - Most software engineering is about communicating with other programmers
 - UI is about communicating with users
- The user is always right
 - Consistent problems are the system's fault
- ...but the user is not always right
 - Users aren't designers

Iterative Design

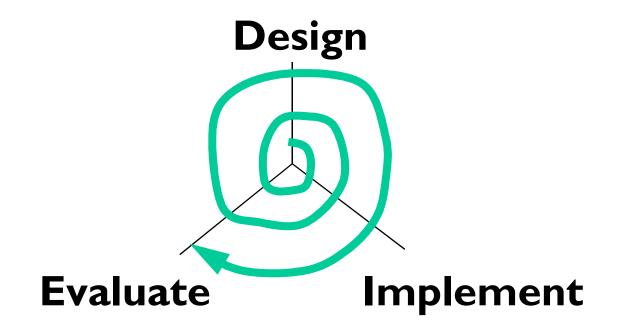

• Ul development is an iterative process

- Iterations can be costly
 - If the design turns out to be bad, you may have to throw away most of your code

Spiral Model

 Use throw-away prototypes and cheap evaluation for early iterations

Usability Defined

- Usability: how well users can use the system's functionality
- Dimensions of usability
 - Learnability: is it easy to learn?
 - Efficiency: once learned, is it fast to use?
 - Memorability: is it easy to remember what you learned?
 - Errors: are errors few and recoverable?
 - Satisfaction: is it enjoyable to use?

Lecture Outline

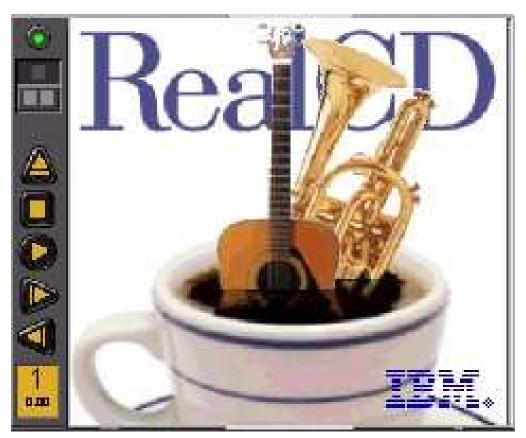

Usability Goals

- Learnability
- Visibility
- Efficiency
- Error handling
- Simplicity

Learnability

Metaphorical Design

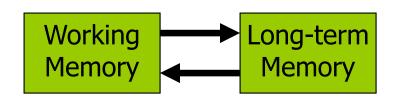

Source: Interface Hall of Shame

People Don't Learn Instantly

Some Facts About Memory & Learning

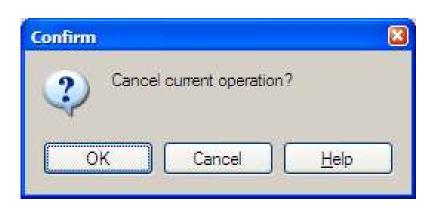

- Working memory
 - Small: 7 ± 2 "chunks"

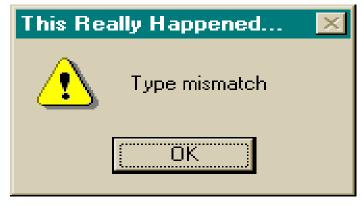

- Short-lived: gone in ~10 sec
- Maintenance rehearsal is required to keep it from decaying (but costs attention)
- Long-term memory
 - Practically infinite in size and duration
 - Elaborative rehearsal transfers chunks to long-term memory

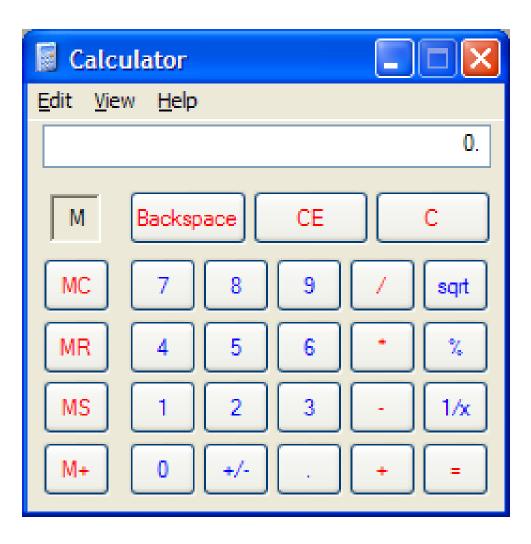

Design Principles for Learnability

- Consistency
 - Similar things look similar, different things different
 - Terminology, location, argument order, ...
 - Internal, external, metaphorical
- Match the real world
 - Common words, not tech jargon
- Recognition, not recall
 - Labeled buttons are better than command languages
 - Combo boxes are better than text boxes

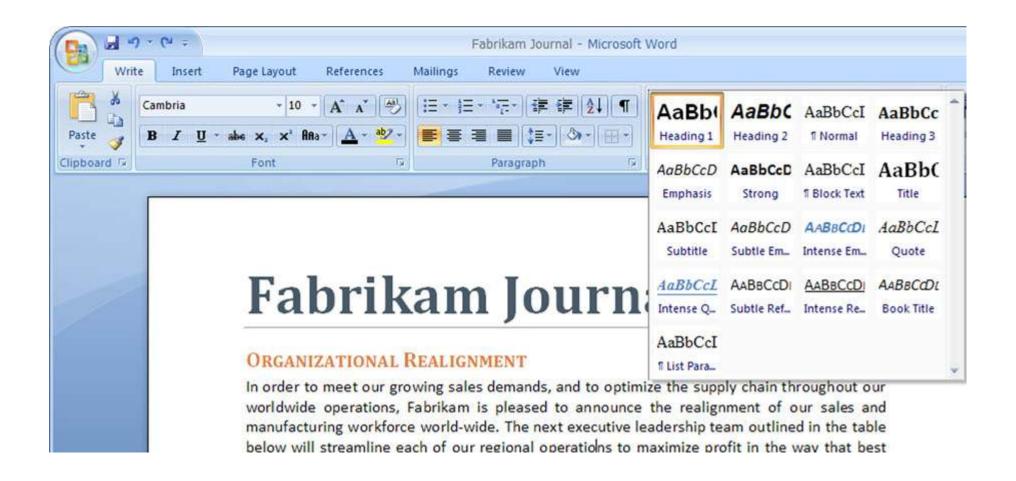

Visibility

Feedback

Some Facts About Human Perception

- Perceptual fusion: stimuli < 100ms apart appear fused to our perceptual systems
 - 10 frames/sec is enough to perceive a moving picture
 - Computer response < 100 ms feels instantaneous
- Color blindness: many users (~8% of all males)
 can't distinguish red from green

Design Principles for Visibility

- Make system state visible: keep the user informed about what's going on
 - Mouse cursor, selection highlight, status bar
- Give prompt feedback
 - Response time rules-of-thumb

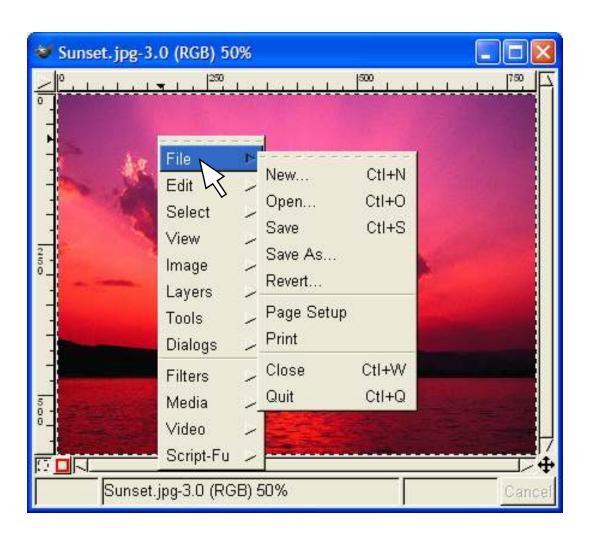

```
< 0.1 sec seems instantaneous
```

0.1-1 sec user notices, but no feedback needed

I-5 sec display busy cursor

> I-5 sec display progress bar

Efficiency

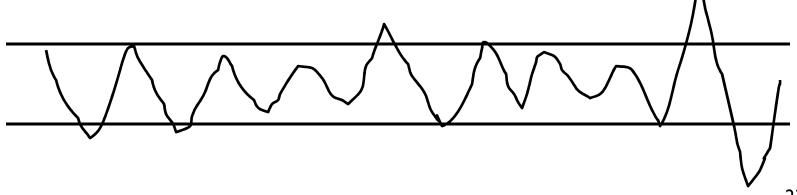

Some Facts About Motor Processing

- Open-loop control
 - Motor processor runs by itself
 - Cycle time is ~ 70 ms
- Senses Perceptual Cognitive Motor Muscles

 Feedback

- Closed-loop control
 - Muscle movements (or their effect on the world) are perceived and compared with desired result
 - Cycle time is ~ 240 ms

Pointing Tasks: Fitts's Law

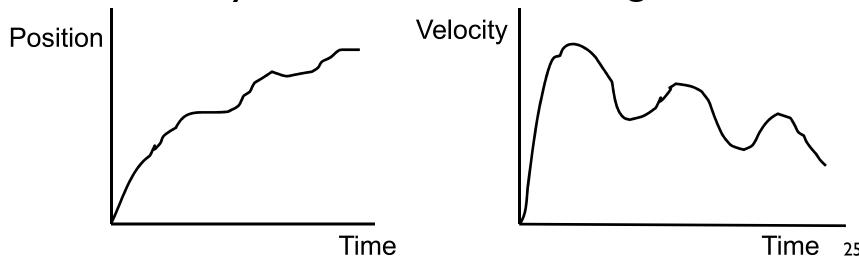

How long does it take to reach a target?

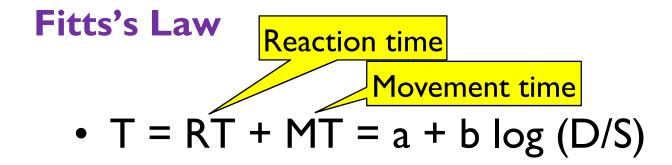

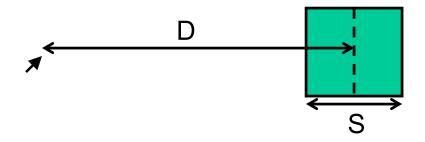

- Moving mouse to target on screen
- Moving finger to key on keyboard
- Moving hand between keyboard and mouse

Analytical Derivation of Fitts's Law

- Moving your hand to a target is closed-loop control
- Each cycle covers remaining distance D with error ED
- After 2 cycles, within ε^2D of target

 log(D/S) is the index of difficulty of the pointing task

Path Steering Tasks

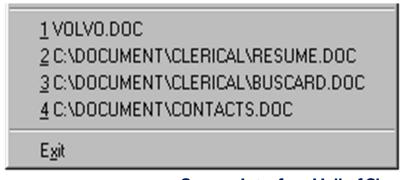

- Fitts's Law applies only if path to target is unconstrained
- But the task is much harder if path is constrained to a tunnel

This is why cascading menus are slow!

Design Principles for Efficiency

- Fitts's Law and Steering Law
 - Make important targets big, nearby, or at screen edges
 - Avoid steering tasks
- Provide shortcuts
 - Keyboard accelerators
 - Styles
 - Bookmarks
 - History

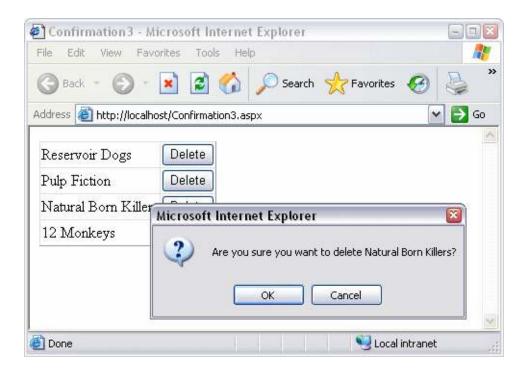

Mode Error

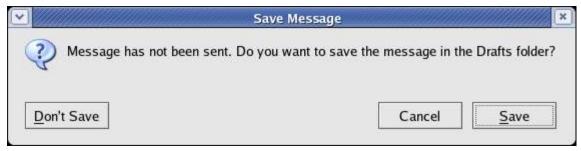

- Modes: states in which actions have different meanings
 - Vi's insert mode vs. command mode
 - Drawing palette
- Avoiding mode errors
 - Eliminate modes entirely
 - Visibility of mode
 - Spring-loaded or temporary modes
 - Disjoint action sets in different modes

Confirmation Dialogs

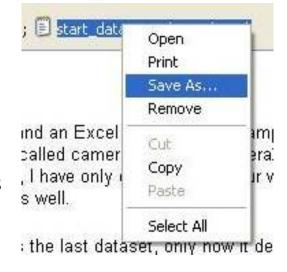

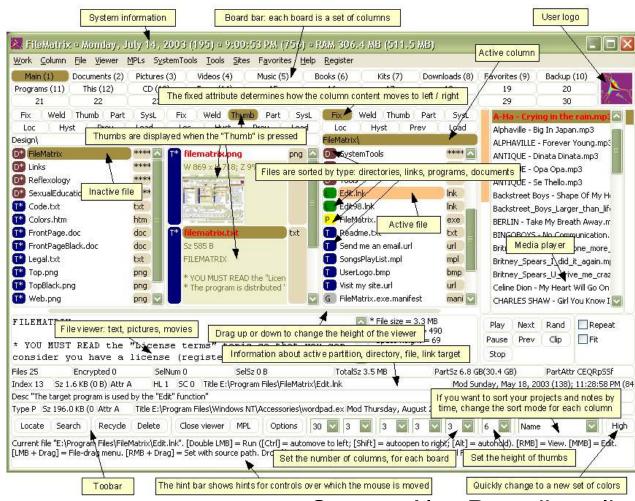

Design Principles for Error Handling

- Prevent errors as much as possible
 - Selection is better than typing
 - Avoid mode errors
 - Disable illegal commands
 - Separate risky commands from common ones
- Use confirmation dialogs sparingly
- Support undo
- Good error messages
 - Precise
 - Speak the user's language
 - Constructive help
 - Polite

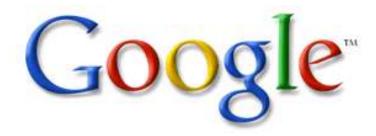

Simplicity

Simplicity

Advertise with Us - Business Solutions - Services & Tools - Jobs, Press, & Help

@2003 Google - Searching 3,307,998,701 web pages

Design Principles for Simplicity

- "Less is More"
 - Omit extraneous information, graphics, features
- Good graphic design
 - Few, well-chosen colors and fonts
 - Group with whitespace
- Use concise language
 - Choose labels carefully

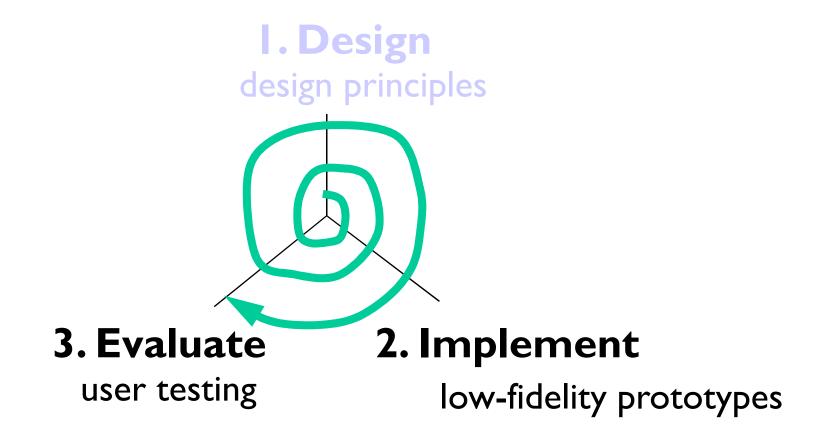

Document your system

- Write the user manual
 - Program and UI metaphors
 - Key functionality
 - Not: exhaustive list of all menus
- What is hard to describe?
- Who is your target user?
 - Power users need a manual
 - Casual users might not
 - Piecemeal online help is no substitute

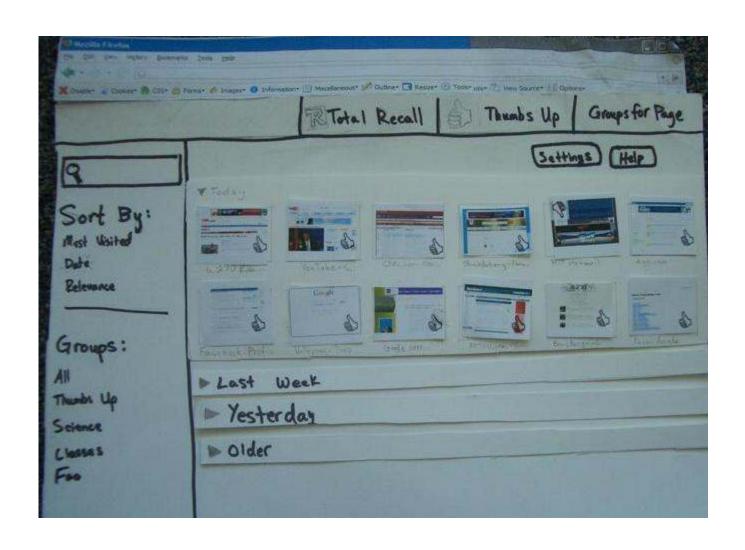

Lecture Outline

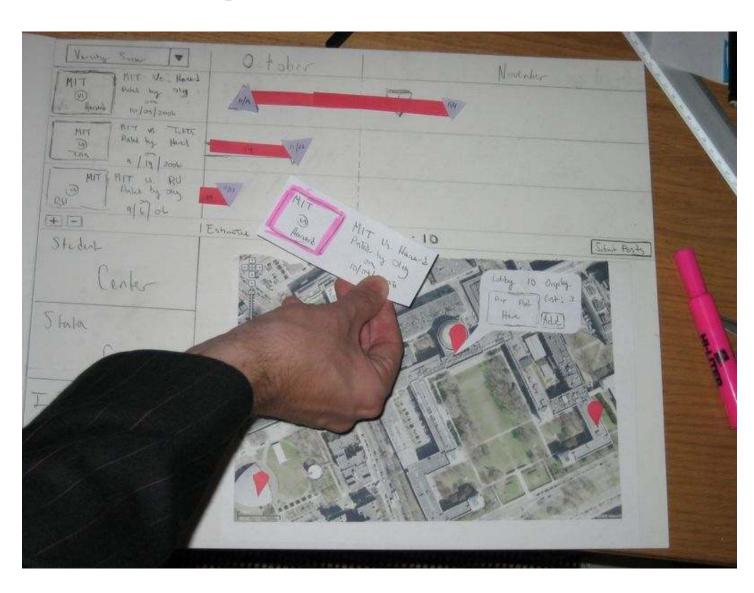

Low-fidelity Prototypes

- Paper is a very fast and effective prototyping tool
 - Sketch windows, menus, dialogs, widgets
 - Crank out lots of designs and evaluate them
- Hand-sketching is OK even preferable
 - Focus on behavior & interaction, not fonts & colors
 - Similar to design of your data structures & algorithms
- Paper prototypes can even be executed
 - Use pieces to represent windows, dialogs, menus
 - Simulate the computer's responses by moving pieces around and writing on them

Paper Prototypes

Paper Prototypes

Paper Prototypes

User Testing

- Start with a prototype
- Write up a few representative tasks
 - Short, but not trivial
 - e.g.: "add this meeting to calendar","type this letter and print it"
- Find a few representative users
 - 3 is often enough to find obvious problems
- Watch them do tasks with the prototype

How to Watch Users

- Brief the user first (being a test user is stressful)
 - "I'm testing the system, not testing you"
 - "If you have trouble, it's the system's fault"
 - "Feel free to quit at any time"
 - Ethical issues: informed consent
- Ask user to think aloud
- Be quiet!
 - Don't help, don't explain, don't point out mistakes
 - Sit on your hands if it helps
 - Two exceptions: prod user to think aloud ("what are you thinking now?"), and move on to next task when stuck
- Take lots of notes

Watch for Critical Incidents

- Critical incidents: events that strongly affect task performance or satisfaction
- Usually negative
 - Errors
 - Repeated attempts
 - Curses
- Can also be positive
 - "Cool!"
 - "Oh, now I see."

Summary

- You are not the user
- Keep human capabilities and design principles in mind
- Iterate over your design
- Write documentation
- Make cheap, throw-away prototypes
- Evaluate them with users
